FOODBRIDGE AI

LEAN CANVAS | SDG 2: ZERO HUNGER | AGENTIC FOOD-RESCUE COORDINATION PROTOTYPE

AICTE | IBM SkillsBuild Machine Learning & Applied AI Internship 2026 | BharatCares

STUDENT PROJECT

Shubha Sakshi • 13 October 2026

1. PROBLEM

• Edible surplus can go unused when pickup is not arranged in time.

• Donors may not know which nearby organisation can accept a food category and quantity.

• Capacity, transport, allergens and handling need human confirmation.

2. CUSTOMER SEGMENTS

• Donors: campus canteens, restaurants, bakeries and event organisers.

• Recipients: NGOs and community kitchens.

• Coordinators and volunteers who organise collection and handover.

3. UNIQUE VALUE

A guided workflow that turns a surplus-food listing into an explainable recipient shortlist, an experimental coordination-priority estimate and a human-reviewed message draft.

4. SOLUTION

• Validate listing details and safety-check confirmation.

• Rank illustrative recipient profiles with an explainable heuristic.

• Predict Low / Medium / High coordination priority using a synthetic-data ML demo.

• Draft a pickup enquiry with Gemini when available.

5. CHANNELS

• Campus / student networks.

• Local NGOs and community kitchens.

• Restaurants, bakeries and event organisers.

• Future pilot via a verified institutional partner.

6. KEY METRICS

Prototype metrics:
• Valid listings and failed-validation reasons.
• Time to generate a shortlist.
• Checklist completion and message-draft generation.

Pilot metrics later: confirmed responses and verified pickups.

7. COST STRUCTURE

• Development and maintenance.
• Hosting and API usage.
• Partner onboarding and verification.
• Secure contact handling and operational coordination.

Current student demo uses illustrative records.

8. REVENUE / SUPPORT

Potential future support hypotheses:
• Institutional or campus partnerships.
• CSR programmes or grants.
• NGO / community-service support.

No revenue model has been validated.

9. UNFAIR ADVANTAGE

Potential differentiation:
• Safety-first human checkpoint.
• Explainable recipient-match factors.
• Combined validation, ranking, urgency demo and message drafting in one workflow.

Partner network is future work, not yet an advantage proven in practice.

10. HIGH-LEVEL CONCEPT

A food-rescue coordination assistant: connect a donor listing to a proposed recipient, a priority estimate and a draft pickup enquiry — while keeping real decisions with people.

Prototype boundaries: demo recipient data • heuristic matching • synthetic-data urgency classifier • Gemini draft only • mandatory human review
